Definition 11.23. [110] If M_1 , M_2 are vector spaces with norms $\|\cdot\|_{M_1}$ and respectively $\|\|_{M_2}$, then φ is an isometry when $\forall x, y \in M_1, ||x - y||_{M_1} = ||\varphi(x) - \varphi(y)||_{M_2}$ (11.24)

$$\forall x, y \in M_1, \|x - y\|_{M_1} = \|\varphi(x) - \varphi(y)\|_{M_2}$$
 (11.24) (rewriting the definition of distance using norms).
