## Exercises

E22.17 [1RK] Discuss the differential equation

$$\begin{cases} y'(x) = \frac{1}{y(x) - x^2} \\ y(0) = a \end{cases}$$

for  $a \neq 0$ , studying in a qualitative way the existence (local or global) of solutions, and the properties of monotonicity and convexity/concavity. <sup>*a*</sup>

Show that the solution exists for all positive times.

Show that for a > 0 the solution does not extend to all negative times.

Difficulty:\*.Show that there is a critical  $\tilde{a} < 0$  such that, for  $\tilde{a} < a < 0$  the solution does not extend to all negative times, while for  $a \leq \tilde{a}$  the solution exists for all negative times; also for  $a = \tilde{a}$  you have  $\lim_{x\to-\infty} y(x) - x^2 = 0$ .

In dotted purple the line of inflections. In dashed red the parabola where the derivative of the solution is infinite. In yellowthe solutions with initial data y(0) = 2, y(0) = 1, y(0) = 1/1000.

Figure 9: Exercise 22.17. Solutions for a > 0

In dotted purple the line of inflections. In dashed red the parabola where the derivative of the solution is infinite. Solutions are drawn with initial data a = -1.4 ("green"), a = -1.0188 "orange") and a = -1.019 ("yellow"). Note that the latter two differ only by 0.0002 in their initial data (indeed they are indistinguishable in the graph for x > -1), but then for x < -1 they move apart quickly, and for x = -2 they are respectively 3.25696 and 2.54856, with a difference of about 0.7 !

Figure 10: Exercise 22.17. Solutions for a < 0

## Solution 1. [1RP]

<sup>&</sup>lt;sup>a</sup>The differential equation is taken from exercise 13 in [2].
